

ENERGY COST IMPACTS ON MISSISSIPPI FAMILIES

The report “Energy Cost Impacts on Mississippi Families”¹ provides information and data on energy expenditures by Mississippi families at different income levels. Energy expenditures include electricity, natural gas, other home heating fuels, and transportation. Key findings indicate that higher energy prices, such as those caused by EPA policies, will harm lower-income and middle-income families in the state.

- ⊕ There are 650,000 lower-income and middle-income families in Mississippi. These families represent 59% of the state’s households and take home, on average, \$1,800 per month (about \$22,000 per year) after taxes. These same families spend 18% of their family budgets on energy, a substantially larger percentage than higher income families.
- ⊕ Real family incomes have declined since 2001. Declining family incomes magnify the effects of higher energy prices on lower-income and middle-income families.
- ⊕ Energy costs are consuming the household incomes of Mississippi’s lower-income and middle-income families at levels comparable to other necessities such as food, housing, and health care.
- ❖ EPA’s Power Plan could increase electricity prices in Mississippi by an average of 13% per year, with peak year increases of as much as 16%.² Because lower-income and middle-income families spend a larger percentage of their incomes on energy, electricity price increases caused by EPA’s Power Plan will fall disproportionately on lower-income and middle-income Mississippi families.
- ⊕ Minorities and senior citizens are especially vulnerable to these electricity price increases due to their lower household incomes.
